                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         length: 0

Sequence 2, Application US/09893615 Patent No. US20020082395A1 GENERAL INFORMATION: APPLICANT: Fischer, Gerald W. Schuman, Richard F. Wong, Hing Stinson, Jeffrey L. TITLE OF INVENTION: OPSONIC AND PROTECTIVE MONOCLONAL AND CHIMERIC ANTIBODIES SPECIFIC FOR LIPOTEICHOIC ACID OF NUMBER OF SEQUENCES: 89 CORRESPONDENCE ADDRESS: ADDRESSE: FINNEGAN, HENDERSON, FARABOW, GARRETT 6

ଦ୍ମ

CORRESSEE: FINNEGAM, HENDERSON, FARABOW, GARRETT &
DUNNER, LLP
STREET: 1300 I Street, NW
CITY: Washington
STATE: DC
COUNTRY: USA
ZIP: 20005-3315
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARRE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/99/893,615
FILING DATE: 29-Jun-2001
ATTORNEY/AGENT INFORMATION:
REGISTRATION NUMBER: 32,220
REFERENCE/DOCKET NUMBER: 32,220
REFERENCE/DOCKET NUMBER: 04995.0041-00000
TELEPHONE: 202-408-4400
INFORMATION FOR SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LENGTH: 15 amino acids
TYPE: amino acid
STRANDEDNESS: «Unknown»
TOPOLLOGY: linear

FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME RESPONSIBLE FOR MOST OF THE REPLICATIVE SYNTHESIS IN BACTERIA. THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXONUCLEASE ACTIVITY. THE BETA CHAIN IS REQUIRED FOR INITIATION OF REPLICATION ONCE IT IS CLAMPED ONTO DNA, IT SLIDES FREELY (RITHERFOTTONNAT AND ARCH.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               _PSEPU

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           + (DNA) (N).

SUBGURIT: CONTAINS A CORE (COMPOSED OF ALPHA, EPSILON, AND THET CHAINS) THAT ASSOCIATES WITH A TAU SUBGURIT HICH ALLOW THE CORD DIMERIZATION TO FORM THE POLITI' COMPLEX. POLITI' ASSOCIATES WITH B GAMMA, DELTA, DELTA', PS AND CHI) AND WITH THE BETA CHAIN GAMMA, DELTA, DELTA', PS AND CHI) AND WITH THE BETA CHAIN (BY SIMILARITY).

SUBCELLULAR LOCATION: Cytoplasmic (By Similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME
RESPONSIBLE FOR MOST OF THE RETLEATIVE SYNTHESIS IN BACTERIA.
THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXCHUCLEASE ACTIVITY.
THE ALPHA CHAIN IS THE DNA POLYMERASE (BY SIMILARITY).
CATALYTIC ACTIVITY: N deoxynucleoside triphosphate - N diphosphate

POLITI' ASSOCIATES YOU COMPLEX (COMPOSED OF CHAINS GAMMA, DELTA, DELTA', PS AND CHI) AND WITH THE BETA CHAIN (BY SIMILARITY).

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: BELONGS TO THE DNA POLYMERASE TYPE-C FAMILY. DNAE CHERNATITY:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: DNA POLYMERASE III IS A COMPLEX, MULTICHAIN ENZYME RESPONSIBLE FOR MOST OF THE REPLICATIVE SYNTHESIS IN BACTERIA. THIS DNA POLYMERASE ALSO EXHIBITS 3' TO 5' EXONUCLEASE ACTIVITY. THE ALPHA CHAIN IS THE DNA POLYMERASE (BY SIMILARITY). CATALYTIC ACTIVITY: N deoxynucleoside triphosphate - N diphospha
                                                                                                                                                                                                            srPro; IPR003141; PHP_N.
